SYSTEM EVALUATION QUESTIONNAIRE
"SYNAPSE: A Multi-Model ML and LLM HR ERP for Predictive Analytics and Recruitment"
Based on the ISO/IEC 25010:2023 Product Quality Model

Respondent Code (filled by researcher): SYN-EVAL-_____

Date of Evaluation: _____

Role Evaluated: [ ] HR Manager [ ] Department Head [ ] Staff [ ] Others

Position / Affiliation: _____

11.1 Directions and Rating Scale Definition

Directions: Please indicate your level of agreement with each of the following statements based on your hands-on interaction during the UAT session. Mark the appropriate column using a check mark (✓) corresponding to the 5-point Likert scale below:

Scale Point	Range	Verbal Description	Qualitative Interpretation
5	4.21 – 5.00	Strongly Agree	Excellent / Highly Acceptable (Benchmark Target)
4	3.41 – 4.20	Agree	Very Good / Acceptable (Minimum Threshold)
3	2.61 – 3.40	Neutral	Good / Moderately Acceptable
2	1.81 – 2.60	Disagree	Fair / Needs Improvement
1	1.00 – 1.80	Strongly Disagree	Poor / Unacceptable

11.2 Part I — Quantitative System Quality Ratings

Evaluate the system across the five (5) selected ISO/IEC 25010:2023 product quality characteristics:

Code	Evaluation Statement	1	2	3	4	5
Functional Suitability — The system provides functions that meet stated and implied operational needs under specified conditions.						
FS1	The system provides complete, end-to-end functionality covering the entire employee lifecycle (recruitment, onboarding, 201 records, attendance, leave, performance, training, awards, events, and offboarding).					
FS2	The system provides role-appropriate capabilities and strict access controls tailored to my assigned operational role (HR Manager, Department Head, Staff, or Job Applicant).					
FS3	The recruitment module, applicant tracking pipeline, and deterministic candidate fit scoring provide sufficient, accurate, and actionable information for screening and hiring decisions.					
FS4	Time and attendance tracking accurately records employee punches (with GPS and selfie verification on mobile) and correctly computes worked hours, late minutes, undertime, and overtime according to schedule rules.					
FS5	Leave management accurately calculates chargeable working days (correctly deducting weekends and statutory holidays) and dynamically maintains correct leave balances without data drift.					
FS6	The executive dashboard, attention queue, and analytical audit reports deliver comprehensive, timely, and actionable workforce intelligence.					
Performance Efficiency — The system performs its functions within acceptable time limits, throughput, and resource allocation.						
PE1	Web pages, dashboard metrics, and mobile application screens load quickly and smoothly without disruptive delays or freezes.					
PE2	Daily time record (DTR) punches, leave request filings, and administrative status updates execute and confirm within acceptable time limits.					
PE3	Batch machine learning assessments (Promotion Readiness and Performance Forecasting) process and return results efficiently without timeouts.					
PE4	The conversational LLM assistant responds promptly to queries and natural-language commands within a comfortable turnaround time.					
PE5	System responsiveness remains stable when performing data-intensive tasks such as generating reports, filtering large directories, or exporting CSV files.					
Reliability — The system performs specified functions under specified conditions for a specified period of time.						

RE1	The system operates consistently without crashing, freezing, or throwing unexpected fatal server errors during standard usage.					
RE2	When external services (FastAPI ML service or Gemini API) are unavailable, the system degrades gracefully (displaying cached runs or clear offline notices) without crashing or interrupting core HR operations.					
RE3	The system provides clear, descriptive error notifications and user feedback (toasts) whenever an operation fails, is blocked, or requires correction.					
RE4	Data consistency and transaction integrity are preserved reliably across both web and mobile companion platforms without desynchronization.					
Interaction Capability — The system can be understood, learned, operated, and is attractive to users under specified conditions.						
IC1	The user interface is modern, clean, and visually organized, with a clear visual hierarchy, intuitive iconography, and meaningful status badges.					
IC2	The system's purpose, navigation structure, and individual module features can be easily understood and learned with minimal technical instruction.					
IC3	Navigation across sidebar modules on the web and the bottom navigation tabs on mobile is smooth, logical, and intuitive.					
IC4	Complex multi-step workflows (company setup wizard, employee 201 drawer, appraisal scorecard, hire bridge) provide clear step-by-step guidance.					
IC5	The mobile companion application provides a comfortable and convenient experience for employee self-service timekeeping, leave filing, and profile access.					
IC6	The system provides adequate error protection, confirmation prompts, and warnings before irreversible actions (such as archiving, deleting, or rejecting records).					
Safety, Privacy & AI Governance — The system prevents operational harm, protects confidential data, and ensures ethical, advisory-only AI behavior.						
SA1	The system strictly enforces multi-tenant data isolation, ensuring no user can access, query, or view another organization's confidential HR data.					
SA2	Sensitive personal information and Philippine statutory government IDs (TIN, SSS, PhilHealth, Pag-IBIG) are securely encrypted and masked to protect employee privacy.					
SA3	Machine learning predictions and AI candidate insights function strictly as advisory decision-support tools, never making autonomous employment decisions (hiring, firing, promotion).					
SA4	The machine learning models provide transparent, interpretable explanations (signed factor contributions for promotion and trajectory bands for performance).					
SA5	The LLM assistant strictly respects role permissions, withholds designated sensitive employee fields, and resists					

	prompt injection attempts.					
SA6	Consequential or irreversible operations proposed through the AI assistant (such as hiring an applicant or archiving records) require explicit human confirmation before execution.					

11.3 Part II — Qualitative Open-Ended Feedback

Please provide your candid qualitative assessment and recommendations regarding SYNAPSE:

1. System Strengths:
What do you consider to be the greatest strength or most valuable capability of SYNAPSE?

_____
_____

_____
_____

_____
_____

2. Opportunities for Improvement:
What specific feature or workflow most needs enhancement or refinement prior to institutional deployment?

_____

_____

_____

_____

3. AI Governance & Data Privacy:
Do you have any concerns regarding algorithmic fairness, advisory AI decision-support, or employee data privacy?

_____

_____

_____

_____

4. General Recommendations:
Please share any additional observations, feature requests, or recommendations for the research team:

_____

_____

_____

_____

11.4 Formal Evaluator Attestation and Signature

I hereby confirm that I have evaluated the SYNAPSE system through hands-on task execution during the User Acceptance Testing session, and that the ratings and qualitative feedback provided above reflect my honest, independent, and objective assessment.

Evaluator Signature over Printed Name:_____

Designation / Position:_____

Organization / Company:_____

Date of Evaluation:_____
